

This homework was particularly confusing for me because of how open ended proofs can be, especially in this class. There sometimes can be multiple invariants, or other things, to prove, making it harder to find the correct one fast enough and therefore taking lots of time. Dafny was something I got fairly easily, other than the concept of an invariant, which took a little bit of time. Overall, this homework was not super lengthy, but the process of creating a proof I feel like could be more well defined.
