

This homework was unique in the sense that I had to plan out my implementation based on existing code for many functions at one time. I would have to choose which ones to implement first as some relied on others being correctly implemented. What I didn't like about this homework was the lack of clarification in the directions. Question 2 tells us to implement all functions in the program. However, when you go to question 3 it tells us to write pseudocode for the div function and that we should do this PRIOR to implementing it in java. I feel that question 2 should have specified that we hold off on the div function until the latter questions.
