

This homework felt more like an expansion of hw4 than anything new, which I suppose was the intention given what I have read and been assigned. However, if this was intended to be the case, I feel that it is unfair that we were *not* able to see our hw4 grade prior to this homework being assigned. If we had a major flaw in our hw4 implementation (maybe it worked in code but I am referring to in terms of grading and points), we would have had no idea that this was the case, and could have continued to use the exact same hw4 files without a thought. This effectively, and in my opinion, unfairly prevents some students from gaining as many homework points as they can.

In terms of the overall directions, they seemed pretty clear for the most part. However, there were 2 places in the instructions which I felt were relatively unclear and was therefore only able to make an assumption on. For the first one, this was that it felt unclear whether or not our tests for the large data set which we created were supposed to be contained in the ProfessorPathsTest.java file, or another Test file. In my case, I chose to create a secondary testing file for the larger dataset. The second piece of information which felt unclear was how to access the .csv files within our testing code files. At first, I assumed that it would be via "data/(some csv file)", however I only found out that it needed to be "../../data/(some csv file)" after about half an hour of trial and error. What made it more confusing was that I then discovered that Submittity did *not* like this, and in fact required us to change the code back to using "data/(some csv file)" when we submitted to get credit.

Overall this was an enjoyable homework with few hiccups, and I would encourage the staff to continue to build on this homework for future semesters as I felt that it expanded my knowledge.
